

MILD STEEL LOCKER

O+M MANUAL

LOCKERS

One quality of metal lockers that is not frequently discussed is the ease of cleaning and maintenance. Like any other type of locker, metal lockers that are not regularly cleaned and maintained can have shortened life spans and become more prone to rusting and other types of damage.

GENERAL CARE

Ideally, the surfaces of these lockers should be wiped with a damp cloth at least once a month.

LOCKS AND HINGES

Every now and then, the hinges and locks of these lockers need lubrication. This will depend largely on where the lockers are used and how frequently their owners use them. If they are used daily, it is a prudent idea to regularly check the locks and hinges which should be lubricated or repaired accordingly

REPAIRS

Every now and then, you will notice scratches and abrasions on the surfaces of these lockers. In such instances, be sure to act upon these quickly as these could lead to the determination of these metals especially after prolonged exposure to moisture. Abrasions and scratches can be easily covered up by spot-painting the affected areas.

LOST KEYS

It is not unusual for locker users to lose or misplace their keys. For such occasions, it is a good idea to keep a master key within easy reach; otherwise, you may have to destroy a good lock and have it replaced.

Metal lockers are naturally more durable and stronger compared to other types of lockers. However learning how to properly clean and maintain these lockers can significantly increase their life spans, allowing you to get better returns on your initial investment and help in increasing the satisfaction of their users.

Lost keys and parts can be ordered from our service centre please call 01284 727 669
